

ASPARTANE

Inhibits enzymes that help memory, exhaust thinking ability, steals water. Stimulates taste buds. Raises blood sugar, increases insulin. Brain says there is a whole pile of sugar here, sends a message to liver to store as fat.

Now so much gets stored so you are hungry again so you eat more, a lot more than normal. Causes brain and breast tumors, seizures, excessive smell, optic nerve damage, macular degeneration, effects reproductive hormone.

Has a direct effect on the brain. All other precursors to neurons have to be converted from Amino Acids whereas this amino structure goes right into the neuron and rapidly fires it, often causing the neuron to shrivel up.

Aspartane is a neuro toxin.
